Multifactor Authentication (MFA)

If another person gets your password or security pin, they will have access to your data or more. To defend against that event, Multifactor Authentication or MFA is an authentication system that requires more than one distinct authentication factor for successful authentication such as receiving a phone call or a security pin number by text. Go to [What is: Multifactor Authentication \(microsoft.com\)](https://www.microsoft.com/en-us/security/default) to watch a short 2 minute Microsoft Security video about MFA.
